¹⁰Oklahoma Climatological Survey

1. Use 4 different land surface models:

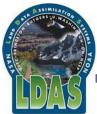

- MOSAIC (NASA/GSFC)
- NOAH (NOAA/NWS/NCEP)
- VIC (Princeton University/University of Washington)
- Sacramento (NOAA/OHD)

2. Force models with Eta model analysis (EDAS) meteorology, except use actual observed precipitation (Stage IV radar product merged with gages) and downward solar radiation (derived from satellites)

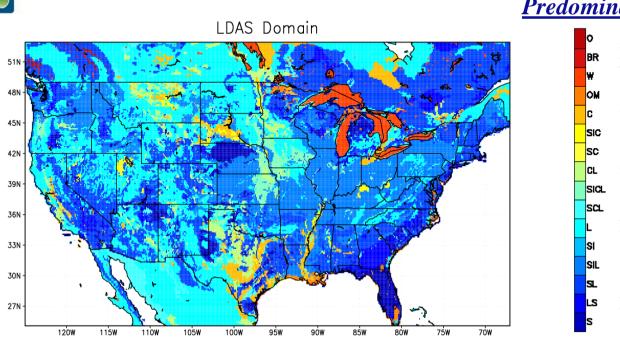

3. Evaluate results with all available observations, including soil moisture, soil temperature, and fluxes (this talk), and snow cover and runoff (next talk)

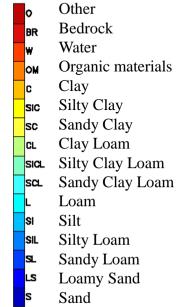

Introduction

Predominant soil type

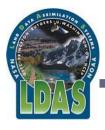

• Domain

- $125^{\circ}W-67^{\circ}W, 25^{\circ}N-53^{\circ}N$
- Resolution of Model Simulations
 - $-1/8^{\circ} \approx 14 \text{ km x } 11 \text{ km}$

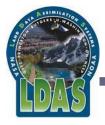

- 1. Can land surface models forced with observed meteorology and radiation accurately calculate soil moisture?
- 2. If not, what are the relative contributions to the differences between models and observations of errors in the soil moisture observations or of the differences between model and observed:
 - a. Forcing?
 - **b. Soil properties?**
 - c. Vegetation?
 - d. Scales?
 - e. Vertical resolution?
 - f. Tiling or variable infiltration assumptions?

The four LDAS land surface schemes were run for the period from October 1, 1997 through September 30, 1999, with a oneyear antecedent spinup (October 1, 1996 - September 30, 1997).

We compare the soil moisture results from these runs to observations from Oklahoma for the last year of this run, as an example of more complete evaluations we will do.

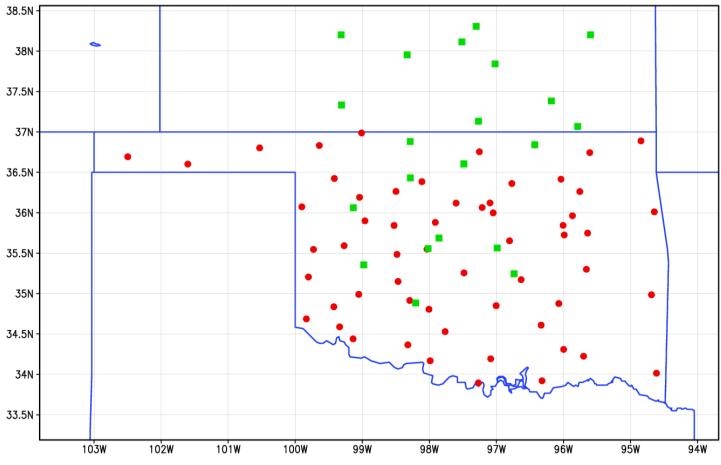

Soil Moisture Observations

• ARM/CART sites • Oklahoma Mesonet sites

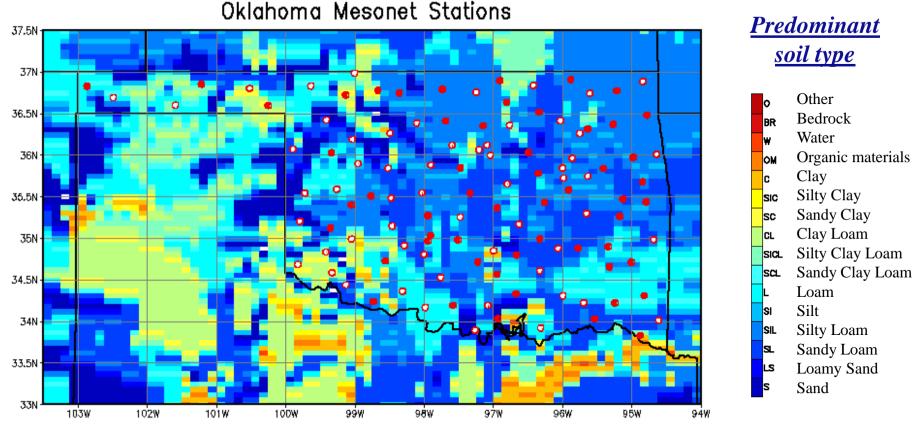

Oklahoma Mesonet

Background is the first most predominant surface soil classes over this region following LDAS parameters.

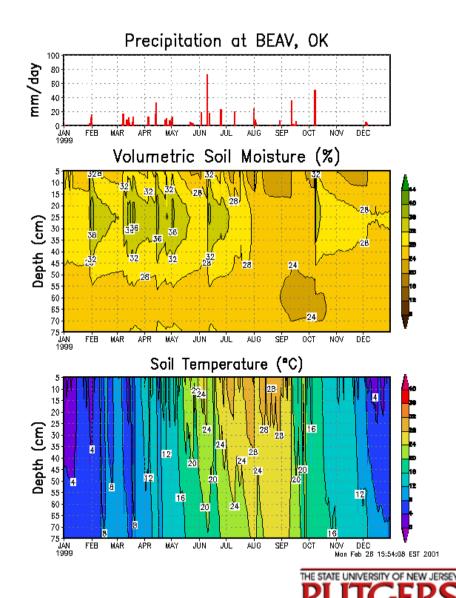

Oklahoma Mesonet

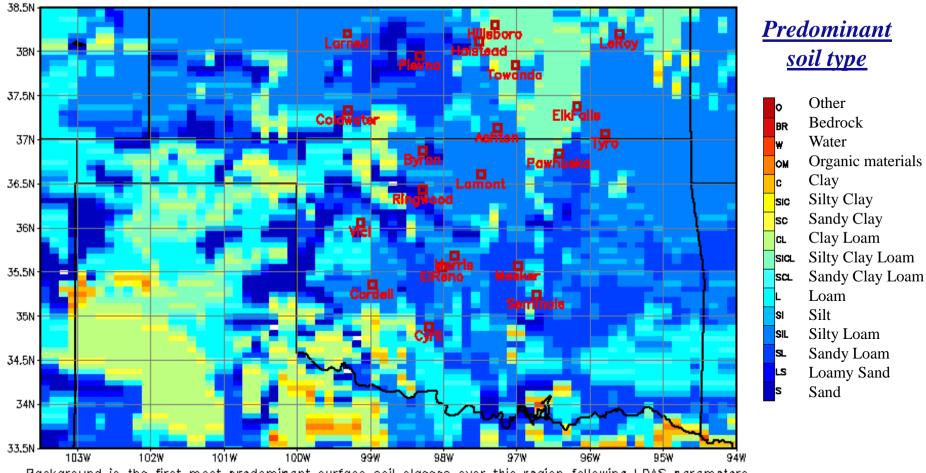

- 115 Mesonet stations covering every county of the state
- Meteorological observations are taken at 5 min intervals:
 - Relative Humidity at 1.5 m
 - Air Temperature at 1.5 m
 - Average Wind at 10 m
 - Precipitation
 - Station Pressure
 - Solar Radiation
- 72 stations have soil moisture and soil temperature observations taken at 15 min intervals.

ARM/CART

Background is the first most predominant surface soil classes over this region following LDAS parameters.

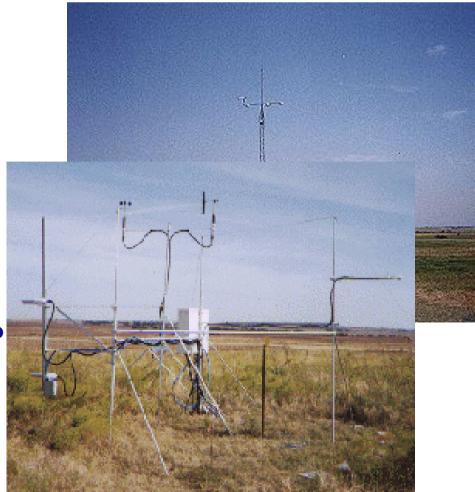

ARM/CART

- 24 Extended Facilities (EF)
- 14 Surface Meteorological Observations System (SMOS) stations
 - Surface pressure
 - Precipitation
 - Air temperature
 - Humidity
 - Wind
- 14 Energy Balance Bowen Ratio (EBBR) stations
 - Latent heat flux
 - Sensible heat flux
 - Net radiation
 - Ground heat flux

ARM/CART

- Solar Infrared Radiation Stations (SIRS)
 - Downward longwave radiation
 - Downward shortwave radiation
 - Upward longwave radiation
 - Upward shortwave radiation
- Soil Water And Temperature System (SWATS)

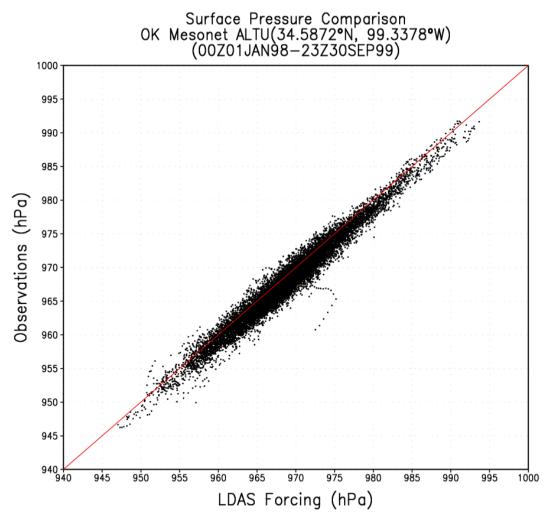

Forcing Validation: Pressure

Forcing Validation : Precipitation

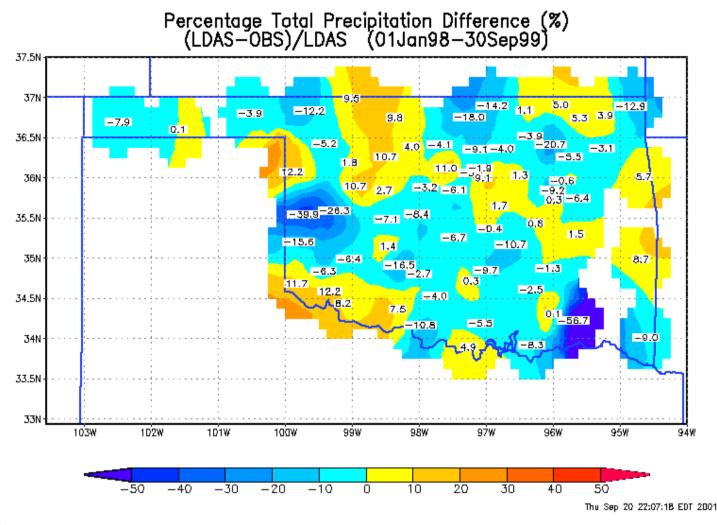

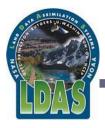

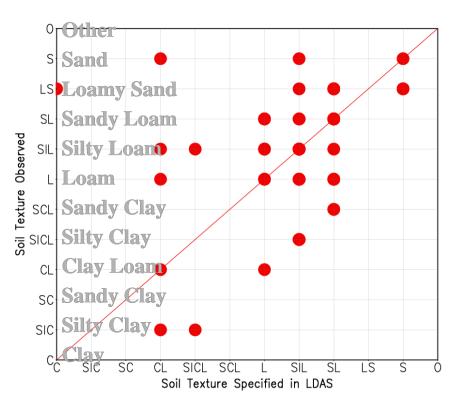

Forcing Validation : Precipitation

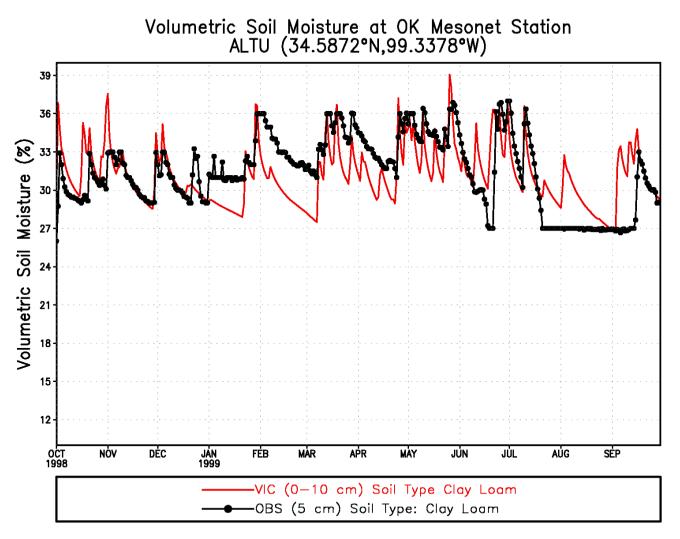

- Soil texture is as important as vegetation in the land surface model simulations.
- Soil texture data set used by LDAS is based on 1 km Penn State STATSGO and 5 min ARS FAO data.
- At Oklahoma Mesonet and ARM/CART stations, soil texture information is also available.
- The actual station observations do not agree very well with those specified for the LDAS models.

Simulation with Matching Soil

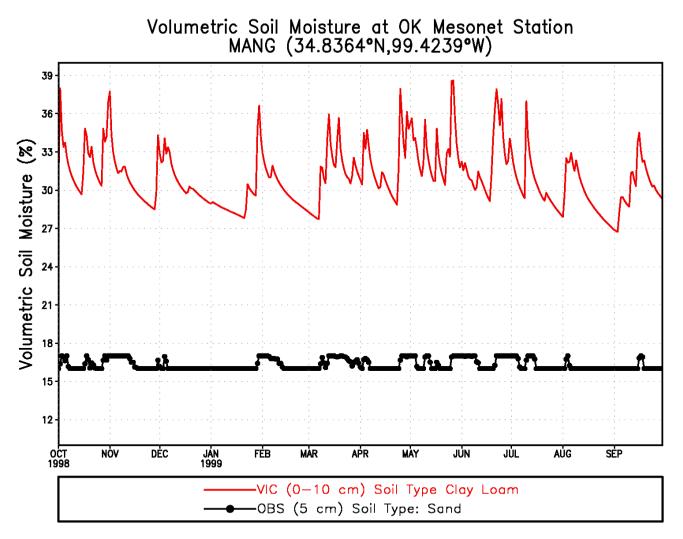

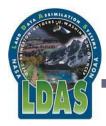

Simulation with Different Soil

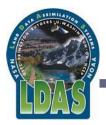

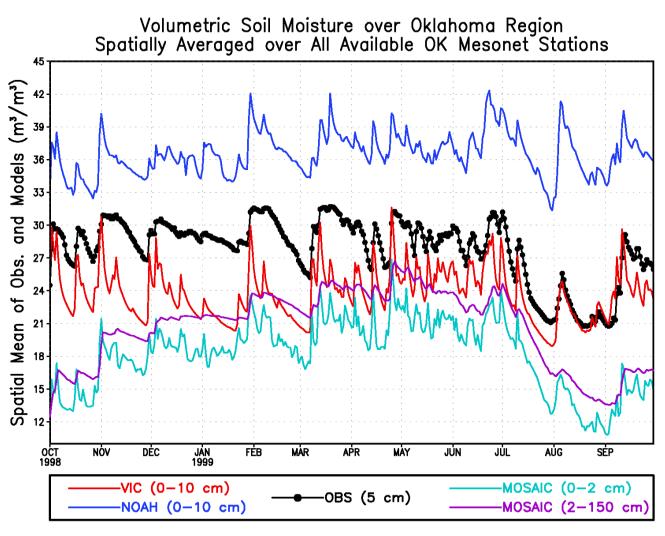

- Control
 - Original LDAS simulation
- Local Forcing
 - Using all available local observed atmospheric forcing at OK Mesonet and ARM/CART stations
- Local Soil
 - Original LDAS forcing, but local soil properties observed at the stations
- Local Forcing and Local Soil
 - Using all available local observed atmospheric forcing and local soil properties observed at OK Mesonet and ARM/CART stations.

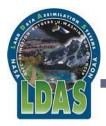

Control Soil Moisture

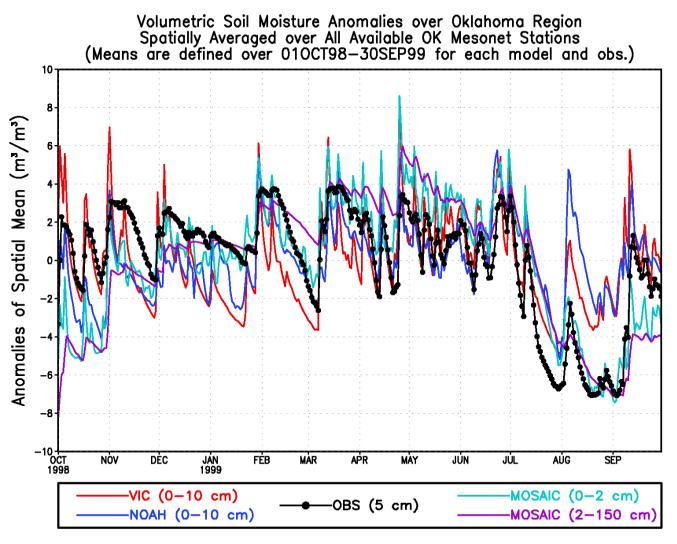

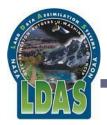

Control Soil Moisture

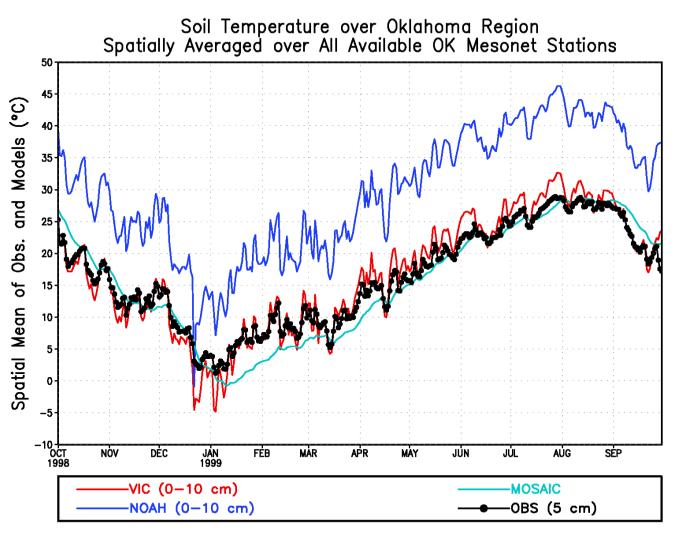

Control Soil Temperature

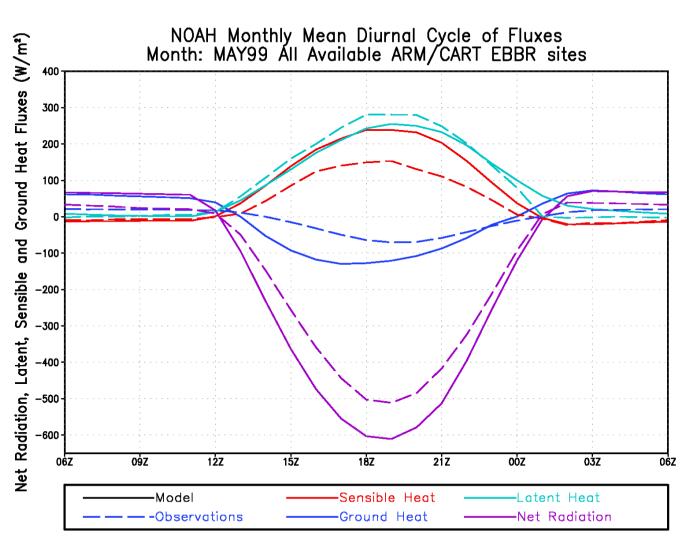

Control NOAH Fluxes

Control MOSAIC Fluxes

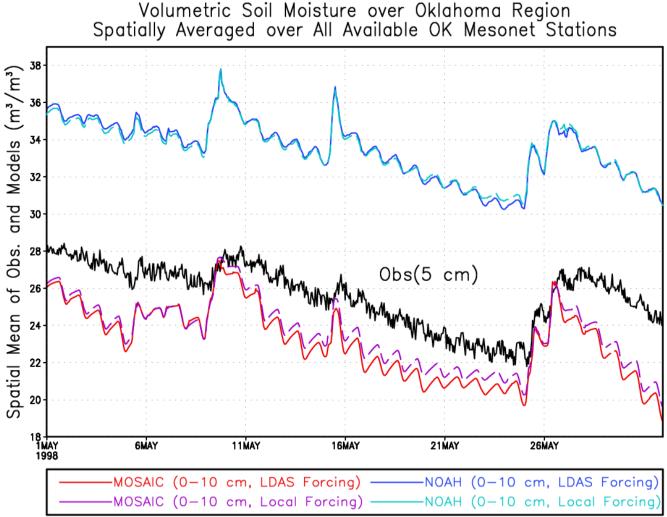

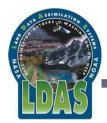

Local Forcing Soil Moisture

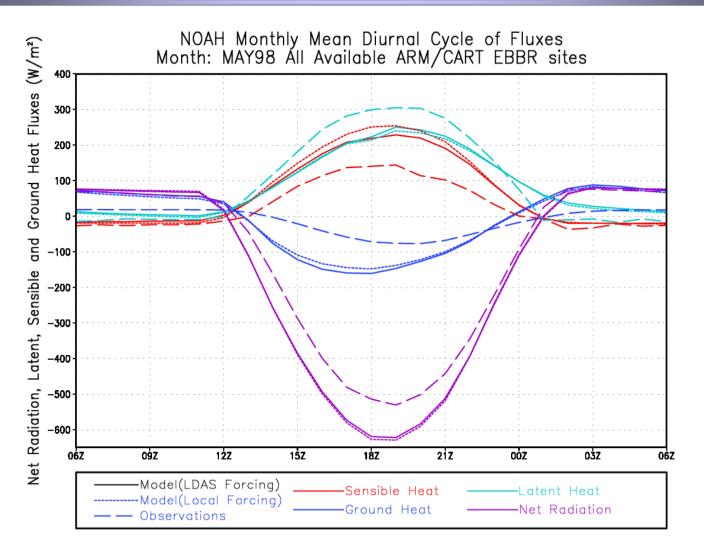

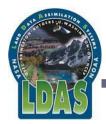

Local Forcing Surface Fluxes

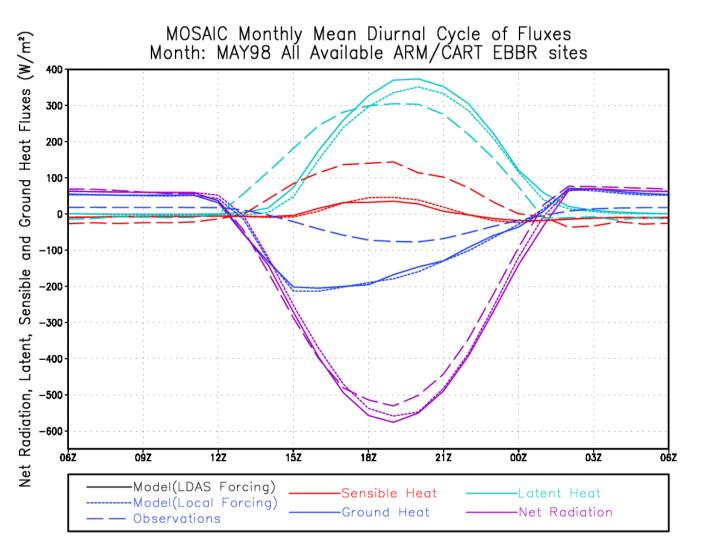

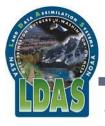

Local Forcing Surface Fluxes

Answers: LDAS Scientific Questions

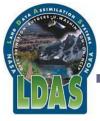

- 1. Can land surface models forced with observed meteorology and radiation accurately calculate soil moisture? Yes
- 2. If not, what are the relative contributions to the differences between models and observations of errors in the soil moisture observations or of the differences between model and observed:
 - a. Forcing? No
 - b. Soil properties?
 - c. Vegetation? **Probably**
 - d. Scales? No, if using spatial average

Yes

- e. Vertical resolution? Probably not
- f. Tiling or variable infiltration assumptions? ?

- 1. A preliminary look at the LDAS simulations of soil moisture shows reasonable simulations of soil moisture and temperature and fluxes compared to Oklahoma observations.
- 2. Differences between model output and observations are not due to differences between actual and LDAS-specified forcing or random observational errors, but are likely due to soil or vegetation differences and model assumptions.
- 3. Conducting these experiments is very difficult, given the task of assembling and quality controlling the complex combination of disparate forcings and the validation observations, the massive amounts of output generated, and typical computer problems, but coordination between the LDAS team members has worked extremely smoothly.
